

Minimizing and Planning for Supply Chain Risk

NASA Supply Chain Quality Assurance Conference 2018

Laura Gloss

Background

- Supply Chain, formally known as purchasing used to be thought of as a clerical function, until recently. This is a change in mindset and taking years to develop.
- Supply chain and the management of it, can be a competitive advantage at its best, or devastate a program or product line if it fails.
- Supply chain needs to be strategic and integrated into business strategies, from capture to execution.
- Appropriate supply chain design, execution, risk assessment and mitigation needs to be evaluated for each commodity, program and the customer base and market it serves.

Supply Chain Design

Supply Chain Team

Team Building

- Forming. This is when a team comes together. This stage is characterized by excitement, optimism
 and anticipation of what the future will bring.
- Storming. At this stage reality sets in and it doesn't quite match what was expected. Members may
 become dissatisfied and/or frustrated. There is some anxiety as they are adjusting to the fact that
 the team isn't working out quite the way that they thought it would. At this point there is a
 resistance, conflict and emotions tend to run high. Members may start looking out for themselves
 instead of doing what is best for the team.
- Norming. At this stage the team has worked out most of the issues. They understand the idea of shared goals, and have learned to cope and accept each other. There is a sense of relief and lowered anxiety, as the members are engaged and supportive of each other.
- Performing. At this stage the team is performing at a very high level. They truly understand each other, and have a strong sense of teamwork and cohesiveness.

Phase 1: Ideology and Talent development - Forming

- Industry needs to shift its thinking from purchasing to supply chain management.
- Less transactional and more strategic
- Teaming and problem solving
- Upstream involvement in design, and business capture
- Gap analysis of current organizational structure and needs to support business
- Result : Hired Product line leads to work with supply base . Engineering and process disciplines and development of commodity teams(site based)

This document does not contain Technical Data or Technology as defined in the ITAR Part 120.10 or EAR Part 772

Phase 2: Risk Mitigation/ Supplier performance - Storming

- Defining roles and responsibilities
- Forming teams
- Supplier metrics Visibility
- Supplier segmentation
- "Advertising" new changes and skill base
- Change from silo to team approach
- Improved communication
- Result: taking longer than expected . Old transactional verses new strategic planning. Silo verses teaming. Comfort zones and information sharing. Hiring more program focused staff.

Phase 3: Risk Mitigation/Supplier Development - Storming/Norming

- Consolidation of supply base
- Upfront mitigation and reviews
- Proactive supply base improvement
- Stabilized supplier segmentation
- Routine monitoring of supply base
- Implementation of corrective actions
- Improved communication
- Roles defined
- Team sharing and mentoring
- Integration into Business Units
- Training and education
- Results: Supplier performance criteria defined. Process walk to identify gaps and define responsibilities..

Phase 4: Supply Chain Design /Process Standardization - Norming

- Integrated into strategy planning with business units
- Evaluate supply base and design supply chain accordingly
- Risk Mitigation and reviews have regular cadence and checklists
- Roles and responsibilities are clearly defined
- Information and Teaming is transparent
- Supply chain issues have structured problem solving approach
- Processes are walked and standard work is formed and documented Group wide
- Product Line leads increase responsibility to SDG – Group wide commodity teams

Phase 5: Group integration/process standardization/cost reduction/continuous improvement - Performing

- Commodity teams work at group levels
- Transparent sharing
- Resource sharing
- Business unit needs brought to commodity teams and supply chain design solutions become part of business capture and execution strategy
- Structured problem solving is standard
- Process standards have been benchmarked, rolled out and are being improved for flow and efficiency
- Work standardization, in regards to, supplier evaluation checklists, kickoff meetings, and risk assessments
- Proactively working with suppliers on cost and leadtime reduction
- Partnering agreements with key suppliers

Overall Score:	100%

Summary

- Redefining face of Supply Chain
- Staff to support success of supplierscollaboration vs posturing
- Supply chain design to meet customer requirements
- Strategic Selection and management
- Predictable and performance based suppliers
- Structured problem solving
- Dfx activities with supply base to minimize risk associated with manufacturability, cost and schedule
